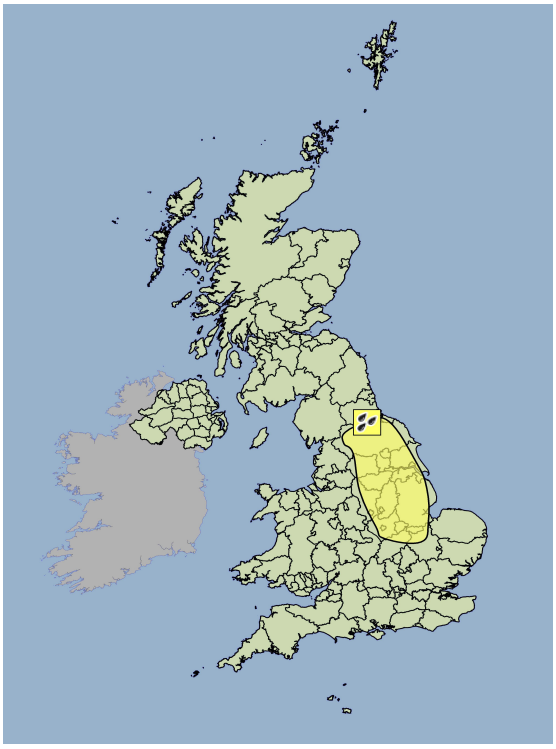
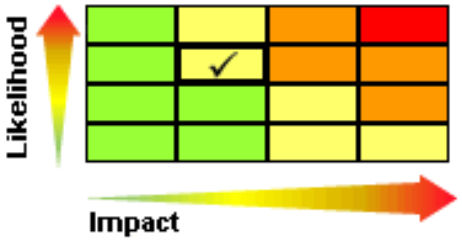
National Severe Weather Warning Service





Chief Forecasters Assessment
The airmass across northern and eastern England will become increasingly unstable through today as a complex set of fronts moves down from the northwest and temporarily weakens the area of high pressure. As a result, scattered thundery showers are likely to develop over northern England and drift southwards. As is usual in such situations, rainfall amounts will vary considerably across the area. Some spots could possibly have over 20 mm of rain falling in less than an hour and very locally 30-40 mm in 3 hours, whilst many other places will miss the worst.

The Met Office have issued a **Yellow Warning** of **Rain**

Valid from **15:00 on Fri, 13th Jun 2014** until **23:45 on Fri, 13th Jun 2014**

Scattered heavy, thundery showers are likely to develop across parts of northern England this afternoon then extend down into the northeast Midlands this evening.

The public should be aware of the risk of localised surface water flooding.
